CS 164 Programming Language and Compilers

Fall 2015

Section 4: LL(1) tables, LR/Bottom-Up Parsing

GSI: Melanie Cebula, Ben Mehne, Matt Miller

- Announcement
 - Midterm Mon (10/05)
 - WA3 due next Wed (9/30) in class
 - PA3 due Tues (10/06) at 11:59pm
 - PA4/WA4 out Wed (9/30)
- Outline
 - 1. LL(1) tables
 - 2. LR parsing

1 LL(1) Parsing Tables

Algorithm 1 Construct a parsing table T for CFG G

```
1: procedure ConstructTable(G,T)
2: for production A \to \alpha in G do
3: for terminal b \in FIRST(\alpha) do
4: T[A,b] = \alpha
5: end for
6: if \alpha \to *\epsilon for each b \in FOLLOW(A): T[A,b] = \alpha
7: end for
8: end procedure
```

Example 1. Consider the following grammar: $E \to Num \mid E/E \mid E+E \mid -E$ Here is the grammar rewritten to be LL(1):

$$\begin{split} E &\rightarrow TE' \\ E' &\rightarrow +E \mid \epsilon \\ T &\rightarrow ST' \\ T' &\rightarrow /T \mid \epsilon \\ S &\rightarrow -S \mid Num \end{split}$$

- 1. Compute the FIRST and FOLLOW sets for the re-written LL(1) grammar. You may need following definitions:
 - **First(A)**: the set of all terminals that could occur first in an expansion of the terminal or nonterminal A (include ϵ if A can expand to ϵ)
 - Follow(A): the set of all terminals that could follow an occurrence of the terminal or nonterminal A in a (partial) derivation. Make sure to include \$ if EOF can follow the terminal.

Answer:

	First	Follow
E	-, Num	\$
E'	$+, \epsilon$	\$
T	-, Num	+, \$
T'	$/, \epsilon$	+, \$
S	-, Num	/, +, \$

2. Draw the LL(1) parsing table for the grammar using the provided algorithm.

Answer:

2 LR Parsing

Idea: LR parsing keeps reduces a string to the start symbol by inverting productions.

1. Consider the following unambiguous grammar that enforces left associativity and correct precedence:

$$\begin{split} E' &\rightarrow E \\ E &\rightarrow E + T \mid T \\ T &\rightarrow T * F \mid F \\ F &\rightarrow NUM \end{split}$$

2. Explain why the gammar is not LL(1).

Answer: For example, E : E + T is left recursive.

3. Write down the LR(1) item sets for the above grammar. (Recall that an LR(1) item is of the form $X:b \bullet c, a$, which says that we are trying to find X by production bc such that X is followed by nonterminal a and that we have accumulated b on the parsing stack)

Answer:

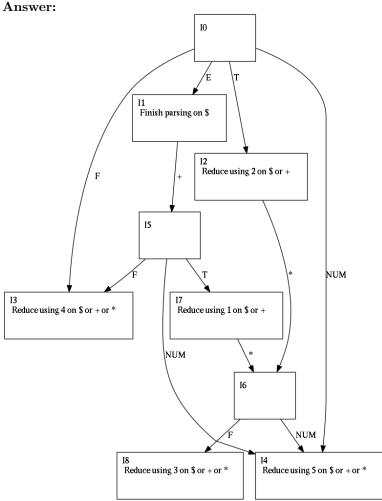

4. Draw the parsing DFA. Each state in the DFA consists of an item set, "shift" transitions from one state to another, and "reduce" rules from that state using production rules (i.e. Reduce using production rule 2 on \$ or +).

Production numbers for the DFA:

1.
$$E \rightarrow E + T$$

2.
$$E \rightarrow T$$

- 3. $T \rightarrow T * F$
- 4. $T \rightarrow F$
- 5. $F \rightarrow NUM$

5. Use the DFA to conclude, i.e. prove, that the grammar in is indeed unambiguous. How can you find ambiguity in the DFA?

Answer:

- (a) There is no conflict in the DFA so for any string that the DFA accepts, there is only one parse tree.
- (b) shift/shift conflict: a non-terminal can be reduced at a state or shifted (on a transition arrow to another state). reduce/reduce conflict: a non-terminal can be reduced in more than one different way at a state.
